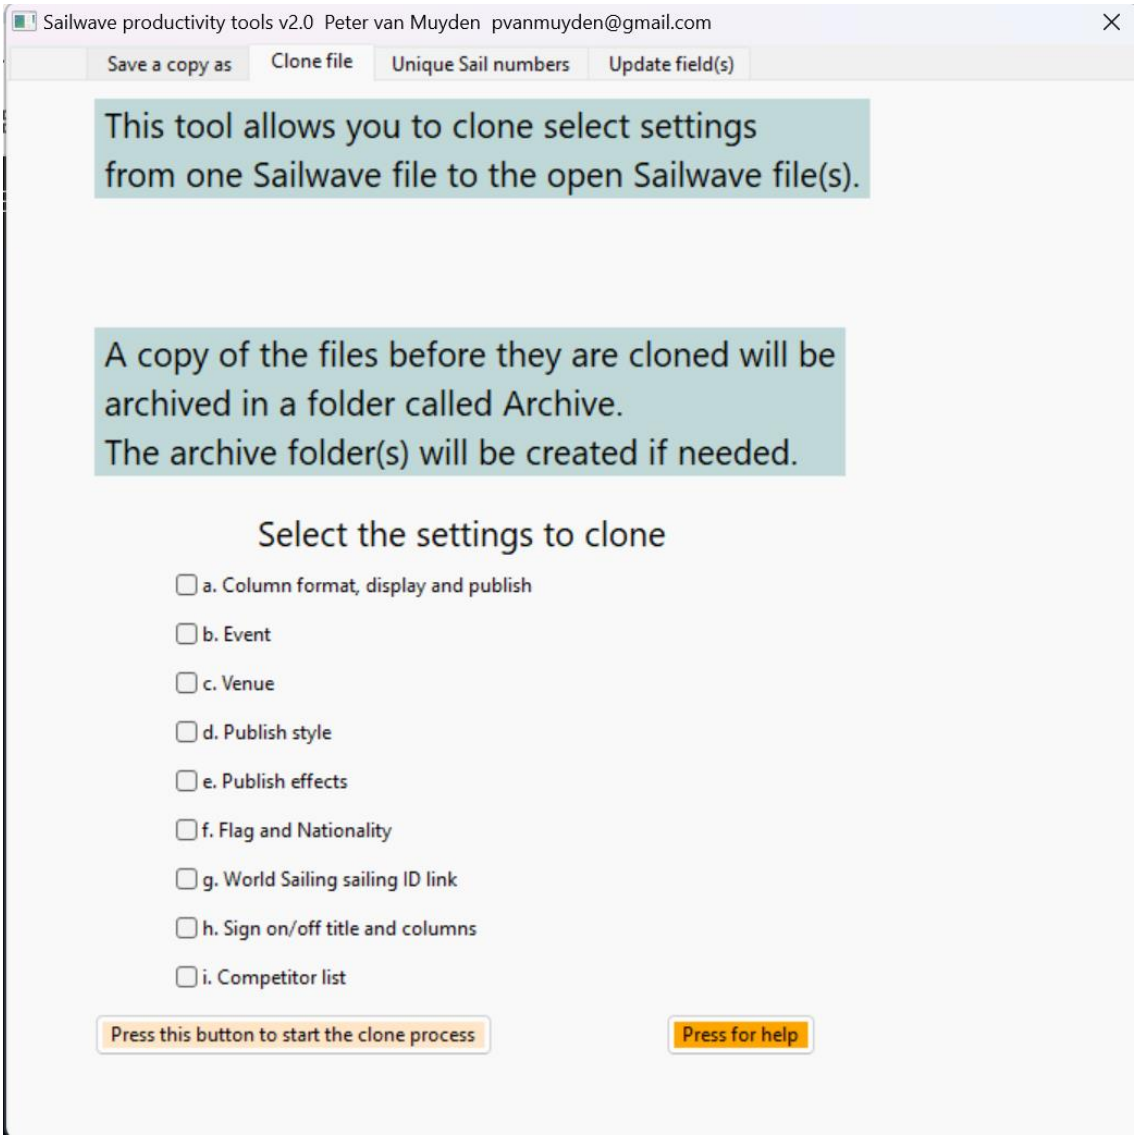
The ***"Clone Display / Publish configuration"*** tool allows you to clone the Sailwave view/publish configuration from one Sailwave file to the current open Sailwave file(s). The Sailwave files must have been saved on your computer.



A copy of the to be cloned Sailwave file will be stored in a folder called Archive which resides in the same folder as the to be cloned Sailwave file(s). This allows you to go back to the original file with the settings prior to cloning. The Archive subfolder will be created is needed.

The process will abort if a open sub window has been detected

The program will prompt you for the Sailwave file to clone from.

The next prompt will confirm the name(s) of the file(s) to clone. The process will check if the Sailwave file has an open sub window

It suggested to create Sailwave templates of regular used configuration and make them read-only to prevent them from being overwritten.
